Storage report · Demo SQL Server

DEMO-SQL01 · 16.0.4135.4 Enterprise Edition (64-bit) — demo data
Period Tue 6 Oct 2026 14:11 – Tue 13 Oct 2026 14:11 (7 days)

SQL Disk Monitor
Generated 13 Oct 2026 14:11
v2.2.0

Summary

4 disk(s) and 6 database(s) were monitored over 7 days. The busiest disk was **D:\ SQLData** at p95 pressure 100 (critical), peaking around 22:00. There are **1 critical** and **4 high** finding(s) below.

HIGHEST P95 PRESSURE
100 Critical
D:\ SQLData

FINDINGS
11
1 critical · 4 high

CAPACITY
1,791 GB
1,269 GB used · 522 GB free

FIRST TO FILL
60 days
D:\ at +2.45 GB/day

STORAGE COST

Findings and recommendations

CRITICAL · Capacity · T:

T:\ TempDB is at its IOPS limit 37.5% of the time

Peak 2,035 IOPS / 170 MB/s against provisioned 500 IOPS / 100 MB/s. Pressure peaks 01:00–02:00.

Once a disk hits its cap, IOs queue and latency climbs. Move hot files to another disk, raise provisioned performance, or use VM-level caching. Also check the VM's own uncached IOPS/MB/s limit, which can cap sooner than the disk. Azure: the next size up is P15 · 256 GiB · 1,100 IOPS · 125 MB/s · +14.36/month.

HIGH · Capacity · D:

D:\ SQLData is at its throughput limit 9.4% of the time

Peak 3,723 IOPS / 200 MB/s against provisioned 5,000 IOPS / 200 MB/s. Pressure peaks 22:00–23:00.

Once a disk hits its cap, IOs queue and latency climbs. Move hot files to another disk, raise provisioned performance, or use VM-level caching. Also check the VM's own uncached IOPS/MB/s limit, which can cap sooner than the disk. Azure: the next size up is P40 · 2 TiB · 7,500 IOPS · 250 MB/s · +96.97/month.

HIGH · Capacity · L:

L:\ SQLLogs is at its IOPS limit 14.1% of the time

Peak 2,734 IOPS / 170 MB/s against provisioned 2,300 IOPS / 150 MB/s. Pressure peaks 01:00–02:00.

Once a disk hits its cap, IOs queue and latency climbs. Move hot files to another disk, raise provisioned performance, or use VM-level caching. Also check the VM's own uncached IOPS/MB/s limit, which can cap sooner than the disk. Azure: the next size up is P30 · 1 TiB · 5,000 IOPS · 200 MB/s · +49.84/month.

HIGH · Capacity · T:

T:\ TempDB runs above its baseline 36% of the time (burst)

Baseline 500 IOPS / 100 MB/s, burst 3,500 / 170. Peak 2,035 IOPS / 170 MB/s.

Credit-based bursting runs out (typically after ~30 minutes at full burst). When it does, the disk drops to baseline and latency spikes. Size for the sustained workload.

HIGH · Capacity

The VM's own disk limit is being reached (Standard_E8ds_v5)

Uncached IO peaks at 4,610 IOPS / 323 MB/s (p95 4,212 / 297) against the VM limit of 12,800 IOPS · 290 MB/s. Disks can't deliver more than the VM allows.

Move to a VM size with higher uncached disk throughput, or enable ReadOnly host caching on data disks so cached reads no longer count against the limit.

MEDIUM · Capacity · L:

L:\ SQLLogs runs above its baseline 9% of the time (burst)

Baseline 2,300 IOPS / 150 MB/s, burst 3,500 / 170. Peak 2,734 IOPS / 170 MB/s.

Credit-based bursting runs out (typically after ~30 minutes at full burst). When it does, the disk drops to baseline and latency spikes. Size for the sustained workload.

MEDIUM · Hotspot · L:

Warehouse.Warehouse_log accounts for 63% of IO wait on L:\ SQLLogs

384 avg IOPS, read 3.8 ms, write 2.4 ms.

Moving this file to its own disk (or spreading it across files on several disks) isolates its load from everything else on the volume.

MEDIUM · Space · D:

D:\ SQLData is on course to fill in about 82 days

Data inside the files is growing +2.21 GB/day, with 180 GB of headroom (148 GB on the volume + 33 GB inside files).

Extend the disk or move growing files before then. The Space page shows which databases are growing.

MEDIUM · Waits

Queries spend 2.5 s/s waiting on physical data-page reads (PAGEIOLATCH)

PAGEIOLATCH_SH 10.1 ms/wait, PAGEIOLATCH_EX 10.2 ms/wait

High PAGEIOLATCH is usually memory pressure or large scans first, and storage speed second. Check buffer pool size and the top read queries.

LOW · Layout

Data and log files share a volume for 1 database(s)

HR

Log writes are sequential and latency-sensitive. Mixing them with random data-file IO on one disk hurts commit latency.

LOW · Files

2 file(s) use percentage autogrowth

HR.HR (10%), HR.HR_log (10%)

Percentage growth gets larger as files grow, so growth events take longer and log files fragment into many VLFs. Use a fixed MB increment.

Space

Disk	Total GB	Used GB	Used	Free GB	Free in files GB	Headroom GB	Volume growth	Data growth	Headroom lasts
C: OS	127	74		53	0.1	53	+0.00 GB/day	+0.00 GB/day	Not growing
